# ***CONTENTS***

- **INTRODUCTION**
- **CLASSFUL ADDRESSING**
  - **Different Network Classes**
  - **Subnetting**
- **Classless Addressing**
  - **Supernetting**
  - **CIDR (classless Interdomain Routing)**

# **INTRODUCTION**

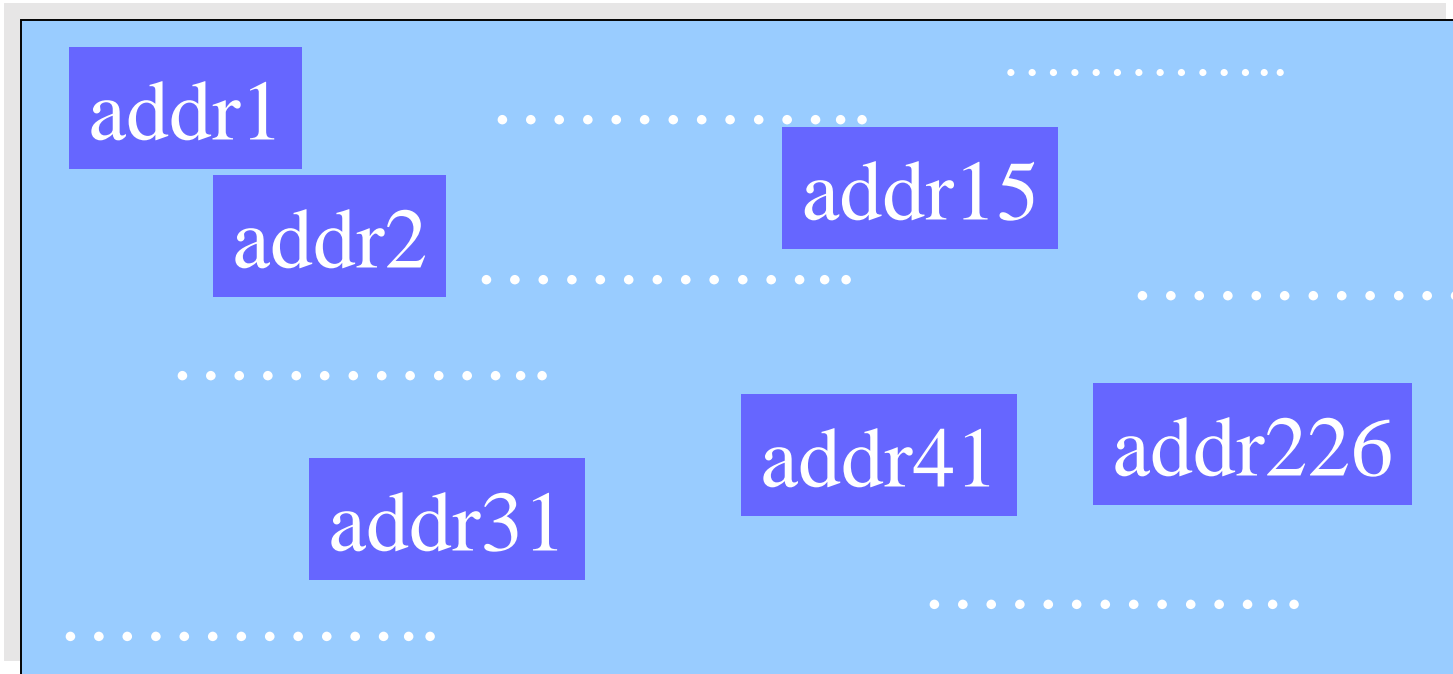

What is an IP Address?

***An IP address is a  
32-bit  
address.***

Note

***The IP addresses  
are unique.***

# Address Space

# *Address space rule*

**The address space in a protocol  
That uses N-bits to define an  
Address is:**

$$2^N$$

# *IPv4 address space*

***The address space of IPv4 is***

***$2^{32}$***

***or***

***4,294,967,296.***

# *Binary Notation*

**01110101 10010101 00011101 11101010**

Figure 4-1

## Dotted-decimal notation

# *Hexadecimal Notation*

**0111 0101 1001 0101 0001 1101 1110 1010**

**75**

**95**

**1D**

**EA**

**0x75951DEA**

## *Example 1*

Change the following IP address from binary notation to dotted-decimal notation.

10000001 00001011 00001011 11101111

*Solution*

*129.11.11.239*

## ***Example 2***

Change the following IP address from dotted-decimal notation to binary notation:

111.56.45.78

## ***Solution***

*01101111 00111000 00101101 01001110*

### ***Example 3***

Find the error in the following IP Address  
111.56.045.78

### ***Solution***

There are no leading zeroes in  
Dotted-decimal notation (045)

## *Example 3 (continued)*

Find the error in the following IP Address  
75.45.301.14

### *Solution*

In decimal notation each number  $\leq 255$   
301 is out of the range

## *Example 4*

Change the following binary IP address  
Hexadecimal notation  
10000001 00001011 00001011 11101111

## *Solution*

0X810B0BEF or 810B0BEF16

# **CLASSFUL ADDRESSING**

Figure 4-2

# Occupation of the address space

Address space

In classful addressing the address space is  
divided into 5 classes:

***A, B, C, D, and E.***

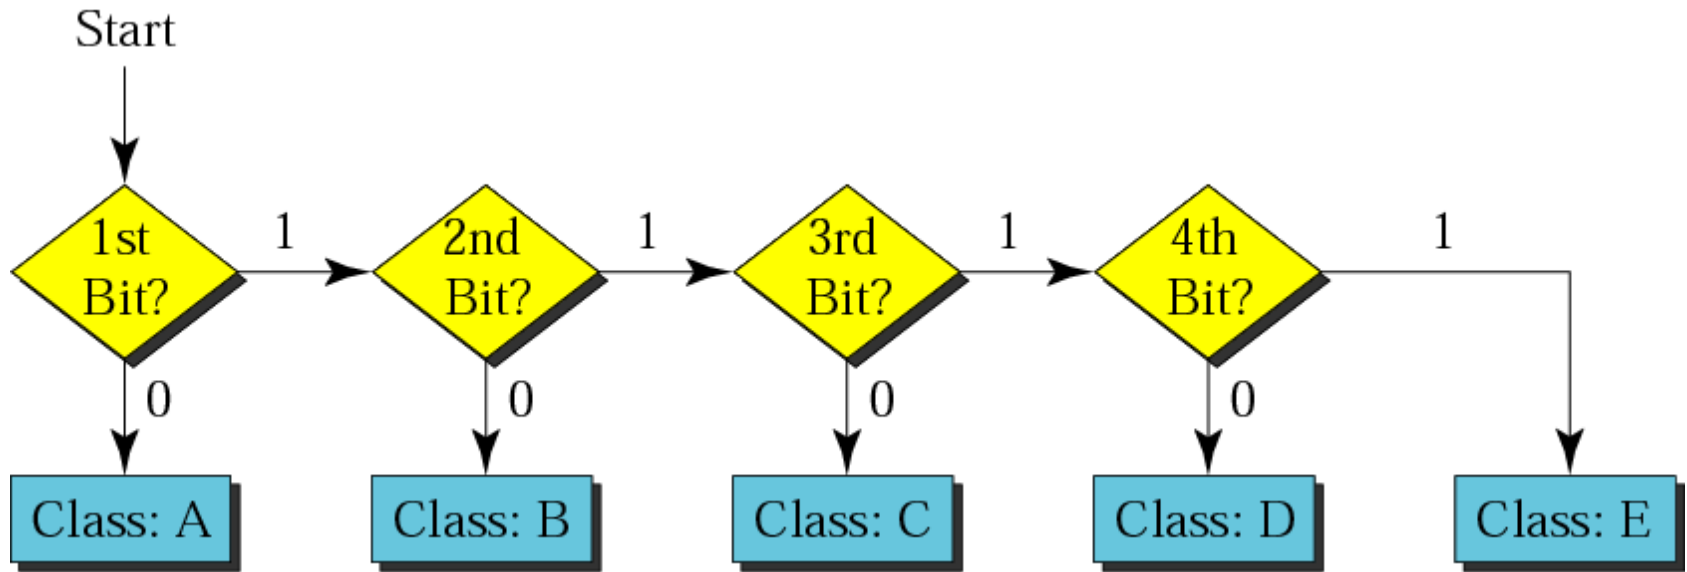

Figure 4-3

## Finding the class in binary notation

	First byte	Second byte	Third byte	Fourth byte
Class A	<b>0</b>			
Class B	<b>10</b>			
Class C	<b>110</b>			
Class D	<b>1110</b>			
Class E	<b>1111</b>			

Figure 4-4

## Finding the address class

## *Example 5*

Show that Class **A** has  
 $2^{31} = 2,147,483,648$  addresses

## *Example 6*

Find the class of the following IP addresses

**00000001 00001011 00001011 11101111**  
**11000001 00001011 00001011 11101111**

## *Solution*

- **00000001 00001011 00001011 11101111**  
1<sup>st</sup> is 0, hence it is Class A
- **11000001 00001011 00001011 11101111**  
1<sup>st</sup> and 2<sup>nd</sup> bits are 1, and 3<sup>rd</sup> bit is 0 hence, Class C

Figure 4-5

## Finding the class in decimal notation

	First byte	Second byte	Third byte	Fourth byte
Class A	<b>0 to 127</b>			
Class B	<b>128 to 191</b>			
Class C	<b>192 to 223</b>			
Class D	<b>224 to 239</b>			
Class E	<b>240 to 255</b>			

## *Example 7*

Find the class of the following addresses

158.223.1.108

227.13.14.88

## *Solution*

- 158.223.1.108

1<sup>st</sup> byte = 158 ( $128 < 158 < 191$ ) class B

- 227.13.14.88

1<sup>st</sup> byte = 227 ( $224 < 227 < 239$ ) class D

## IP address with appending port number

- 158.128.1.108:25
- the four octets before colon is the IP address
- The number after colon (25) is the port number

Figure 4-6

# Netid and hostid

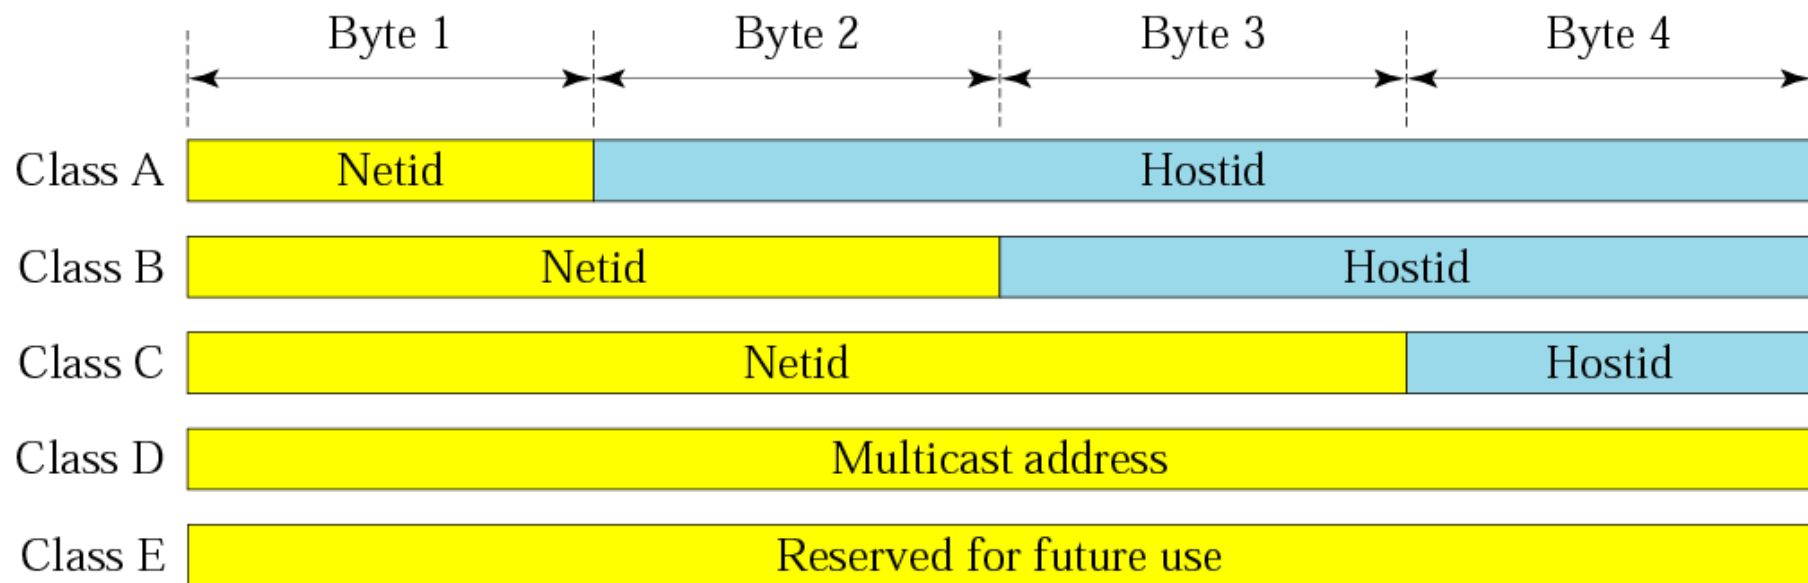

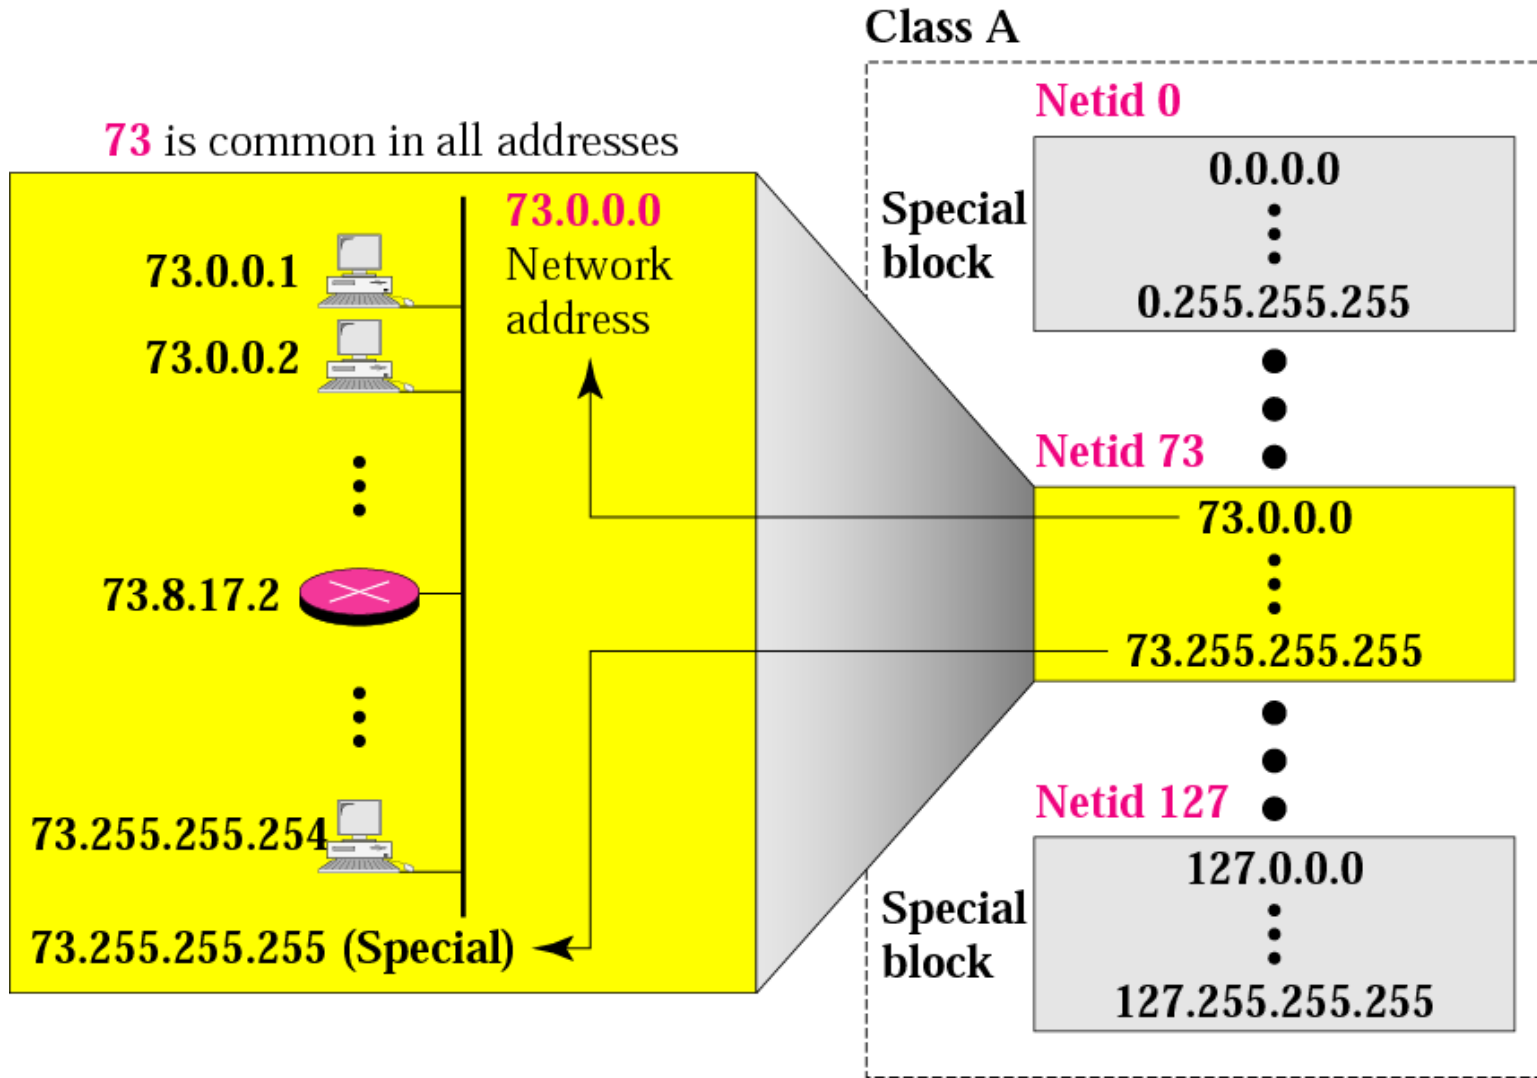

Figure 4-7

# Blocks in class A

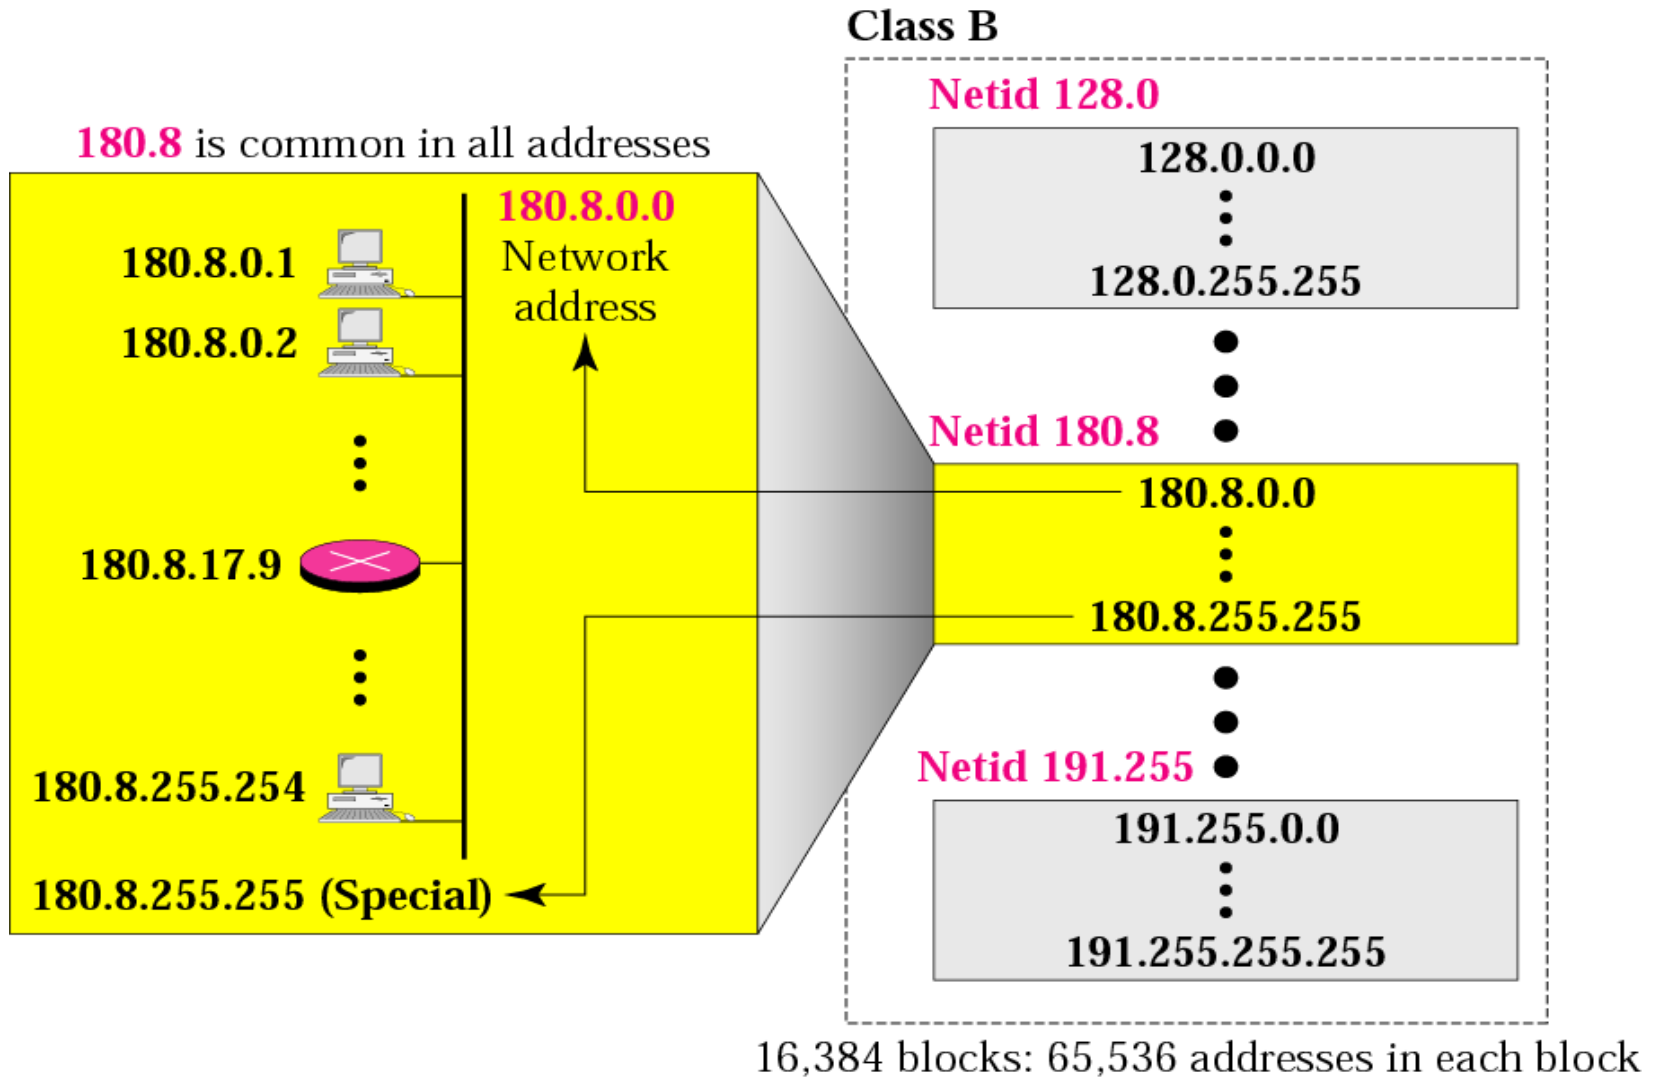

128 blocks: 16,777,216 addresses in each block

Note

***Millions of class A addresses  
are wasted.***

Figure 4-8

# Blocks in class B

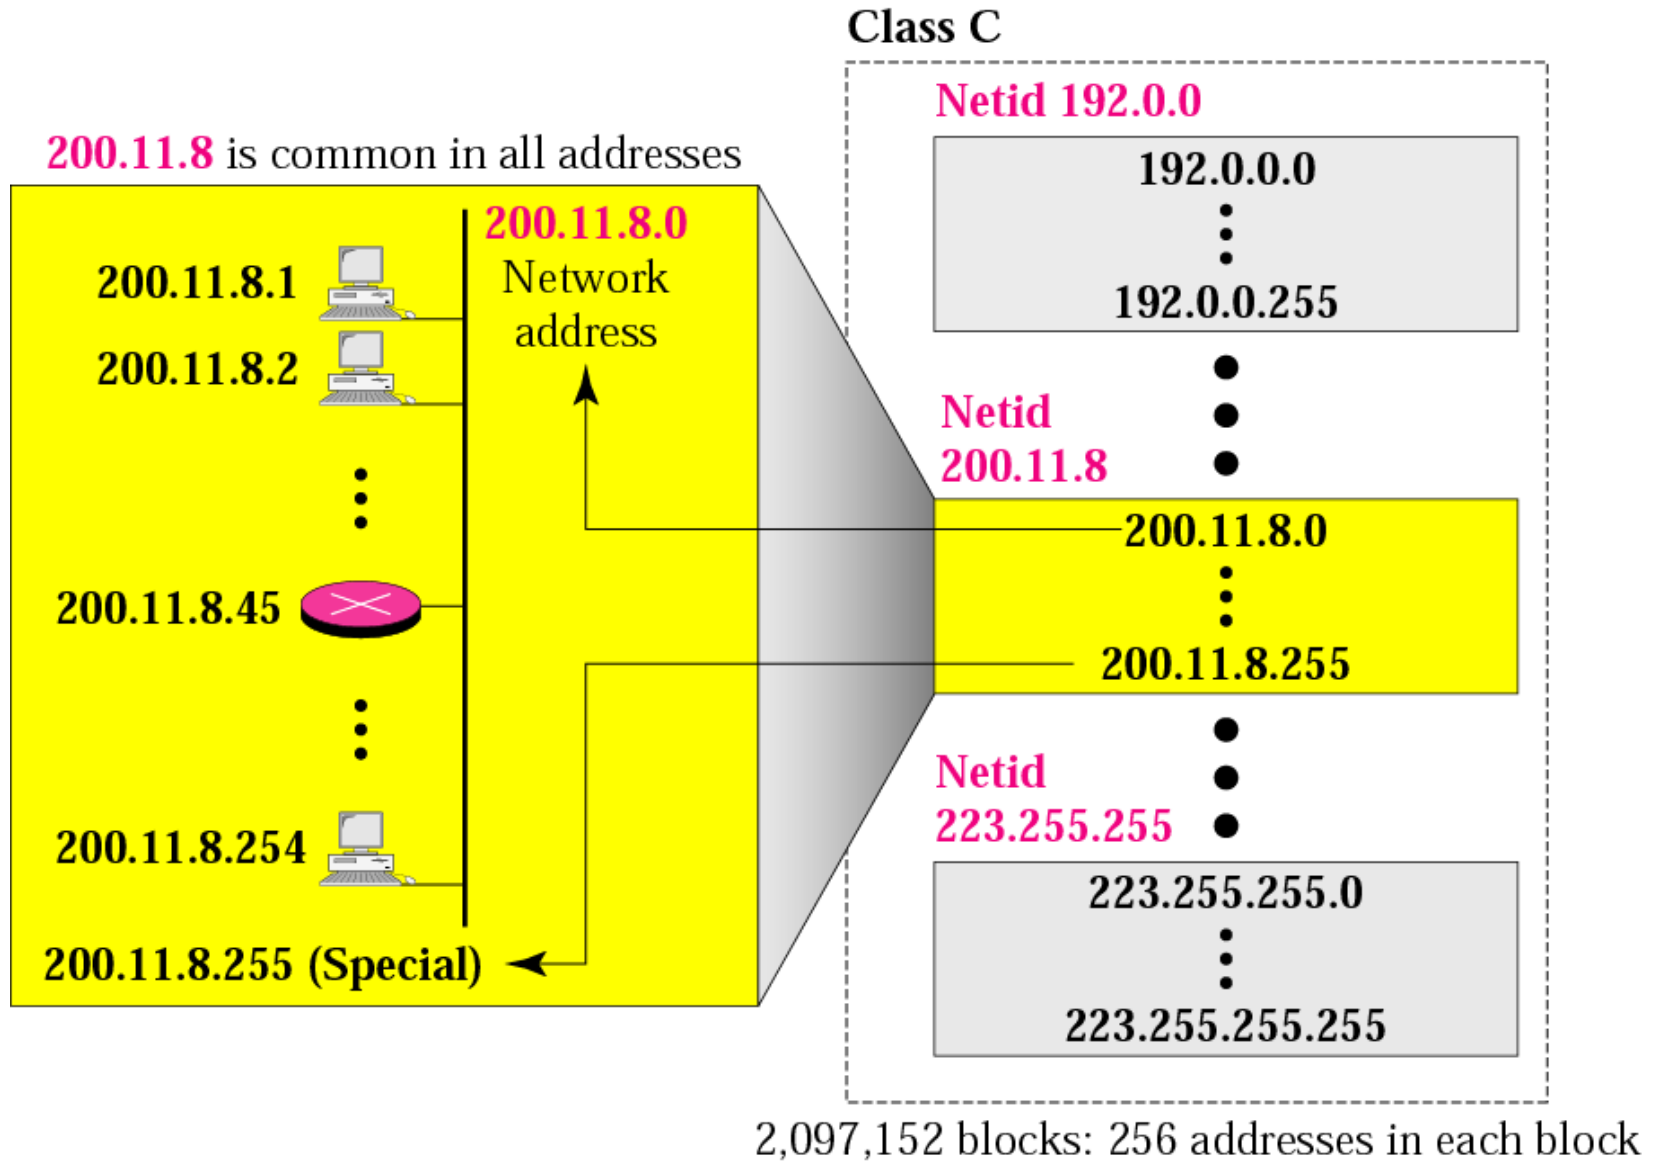

Note

***Many class B addresses  
are wasted.***

Figure 4-9

# Blocks in class C

## Note

***The number of addresses in  
a class C block  
is smaller than  
the needs of most organizations.***

## Note

***Class D addresses  
are used for multicasting;  
there is only  
one block in this class.***

## Note

***Class E addresses are reserved  
for special purposes;  
most of the block is wasted.***
